Why Customers Chose Jira over Alternatives 5
AppDynamics - Client Use Case 5

Atlassian JSD Checklist of Advantages *(From www.atlassian.com)*

Admin experience

- ✓ Can admins tailor the service desk software to the needs of their teams?
- ✓ Out-of-the-box and configurable workflows and requests
- ✓ Multi-lingual support for customers around the world
- ✓ Configurable email notifications and access
- ✓ Customizable portal to show off your branding

Agent experience

- ✓ Does the service desk software help agents streamline their work?
- ✓ Automated task assignment, rules, and canned responses integration to cover routine tasks
- ✓ Custom SLA goals to fit your criteria and hours
- ✓ Mobile app for work on the go
- ✓ RM app and Confluence integration allow work to be done right from the ticket

Customer experience

- ✓ Does the service desk software allow customers to get help where and how they need it?
- ✓ Portal, email channel, and embedded widget meet customers where they are
- ✓ Live chat, social media, phone, and SMS apps extend service channels
- ✓ Configurable workflows, status updates, and notifications, so customers know where their request stands
- ✓ Confluence knowledge base integration with automated article suggestions for self service
- ✓ Customer satisfaction (CSAT) feedback and self-service ratings

Reporting and management

- ✓ Does the service desk software provide reports on the service you're providing and help you forecast what's to come? Does it show your team's value?
- ✓ Default reports on workload, SLAs, customer satisfaction, deflected requests, and more
- ✓ Configurable dashboards highlight the daily information you need
- ✓ Time tracking integrations to analyze productivity
- ✓ Real-time queue updates to see that you're working on the right thing at the right time
- ✓ Exportable reports, customer-facing reports, and billing apps for external stakeholders

Collaboration

- ✓ Does the service desk software enable work across teams?
- ✓ Capability for internal support, external support, or both
- ✓ Permissions and role-based ability to set, view, edit, share, and act on requests to fit your team's needs
- ✓ Tickets linked across teams to involve the right people

Atlassian JSD Checklist of Advantages (From www.atlassian.com)

Ready for ITSM

- ✓ PinkVerify™ and Axelos ITIL™ certification
- ✓ Workflows for incident management, service request management, change management, and problem management
- ✓ Best practice guides and playbooks to help your team continuously improve
- ✓ Asset management and discovery apps
- ✓ Automatic prioritization to triage requests

Resources and support

- ✓ Does the service desk software have everything you need to excel in ITSM?
- ✓ Comprehensive documentation, how-to articles, and best practice guides
- ✓ Demo videos with live chat support
- ✓ Training and certification program
- ✓ Active Atlassian online user community
- ✓ Local Atlassian user groups and Atlassian conferences
- ✓ Network of certified solutions partners available to provide product configuration, implementation, and training
- ✓ Variety of support offerings

Developer resources

- ✓ Can the service desk software integrate with other tools? Can you develop your own solutions and build a service desk that fits your team?
- ✓ Marketplace with over 800 apps to build a service desk that fits your unique needs
- ✓ Free access to APIs with no API call limits and the ability to develop your own apps
- ✓ Developer documentation, including tutorials and the online developer community
- ✓ Transparent uptime status and incident communications

Security and compliance

- ✓ Does the service desk software have data and security policies that won't keep you up at night?
- ✓ Data encryption at rest, frequent data back-ups, disaster recovery
- ✓ Rigorous security testing and assessments and commitment to personal data protection and privacy
- ✓ ISO/IEC compliance
- ✓ SOC2 compliance
- ✓ PCI DSS compliance
- ✓ CSA STAR compliance
- ✓ Configurable in accordance with industry and area standards such as HIPAA and GDPR

Pros and Cons from Verified Client Reviews *(From Trust Radius.com)*

INTEGRATION

PROS

- **Easy integration** with other Atlassian products
- **Merges tickets with knowledge base** for easy creation of knowledge base articles: useful for familiarizing new techs, first call resolution, and/or for developers
- **Tickets can flow freely** among multiple departments/teams

WORKFLOW

PROS

- Manageable **workflow** to ensure all users follow the same process, as well as assign a certain issue to specific people
- Allows support tickets to be moved into other **long-term projects,** as necessary.
- Less hands-on project management: allowing for **more of an Agile approach**: focused on removing impediments and roadblocks.
- Allows for a **larger volume of work** at a faster pace (as we know)
- Realistic **benchmarks can be set** and calculated for each position in the workflow

COMMUNICATION/TRANSPARENCY/COLLABORATION

PROS

- **Communication tools** help you get out of e-mail, closing the gap between the customer and our support team
- **Multiple teams can track tickets** internally rather than conventional phone calls and pen and paper
- All the correspondence can be **maintained in one place**
- Easy to add and **tag others**
- Effective **bug reporting**
- **Notifies team** when there are issues
- Easy c**ollaboration between team members** across departments.
- Portal allows **Clients** to **directly create tickets**, then **check ticket status**.

CUSTOMIZATION/FLEXIBILITY

PROS

- **More flexible and customizable** than competitors: allows you to mold the tool to fit lots of different needs.
- **Highly configurable Notification Scheme**, allowing free customization on who receives notifications and when
- Simple and highly **customizable ticket interface** that can be almost completely **branded** in every aspect to represent your organization.
- Easy to **create service request templates** and **modify built-in templates** to fit your needs
- Flexible tool that **can adapt to lots of different uses** outside of the traditional service desk model
- Issue and **request tracking** across all departments
- **Big dashboards** are easily customizable with lots of options

CONS

Most customizations are via code.

Pros and Cons from Verified Client Reviews (From Trust Radius.com)

ACCESS & TRACKING *(Issues and* Ticketing*)*

PROS

- Track a large number of tickets/requests
- Easy to find and access info in seconds
- Kanban boards for easy visual of ticket status.
- Allows managers to easily see everything that is going on without reading through a lot of emails, and quickly see issues and their full history regarding specific tickets
- Track support issues internally (IT DevOps) and externally (Client Services usage)
- Provides better change management
- Tickets bring transparency in regard to how many tickets relate to what topic, and per user priority (or later up or downgraded),
- Effective "timesheet" that provides detailed information about tasks for each team member
- Converts all emails to JIRA tickets, resulting in less documentation by the customer, which means less re-work to correct ticket fields
- Employees can keep track of the progress or status of their own issues
- Organizes issues in the order received
- Helps prevent information falling through the cracks so that a strong record is being kept

CONS

Unlike competitors, no way to reply to multiple tickets at once (e.g., four tickets in for the same issue)

USABILITY (UI/User-Friendliness)

PRO

Easy to use and learn for both technical and non-technical team members.

CONS

- Navigating through issues outside of a kanban board can be confusing and task heavy.
- Easy to clutter up the tool. It could use some easy cleanup capabilities.
- Learning curve may be a bit steep for non-technical people

REPORTS/ANALYTICS

PRO

- Analyses can be used to plan resources
- Incident and problem management
- Provides transparency into (and improves the manageability of) internal and external client requests and complaints
- Detailed bug reporting
- Gantt chart on the dashboard lets you easily see a project's status, tasks, and progress

MISC (Support, Training, Pricing, etc.)

PROS

- Support is there when you need it, but not always the most responsive or timely if you are running fast projects.
- Not a lot of online help available to get going
- Learning curve can be steep for some advanced features

Why Customers Chose Jira over Alternatives *(From TrustRadius.com)*

- **Zendesk: "**If one of your primary goals with a support solution is to better understand and connect with our customers, Zendesk may not be the best solution. The difficulty with getting historical context about the tickets that are submitted, and the lack of a customer profile to really provide real-time insight into how customers feel about their support experience or just overall sentiment about the organization, are a few of the reasons you may want to consider a more robust solution."
- **Service Now:** "Jira is open source, so it is more versatile than ServiceNow. Jira allows you to create more dashboards, projects, and features than ServiceNow."
- **BMC Helix ITSM (Remedy)**: "Jira is easier to set up and gets going faster. It is easier to customize to fit your needs, and the Dashboard feature and added widgets really help you get the views you want to see. Other products are harder to set up, don't get going as quickly, and lack the dashboard feature as a one-stop spot to view the information most important to you. Jira's dashboard is clean and easy to view. In terms of service requests, Jira has built-in templates to get service requests created fairly easily, and they can be modified with little effort."
- **Hive and Pivotal Tracker**: "There are other systems that perform well, but we always came back to JIRA. One of the reasons is that it has companion systems like Confluence that can integrate and be used with it. Another reason is JIRA can be molded to be many things, not just project management. For us, we use it for firewall requests, change management approval, and automated tasks for employee management. While many can do a few things well, we have found JIRA to do many more things well, and at the end of the day."

AppDynamics - Client Use Case *(From www.atlassian.com)*

- First, the ease of integrations on the same platform with Jira Software meant that teams would be able to seamlessly connect it to tools the company was already using. Second, they could meet their service requirements at a lower price point with easier deployment and fewer modifications. Finally, instead of building expertise from scratch with another vendor, they already had internal Jira experts with the knowledge needed to deploy and maintain Jira Service Desk.
- Improved transparency across the org
- One way that we have taken advantage of the flexibility of Atlassian tools is with a product idea intake portal. They created the portal using a hybrid of a Jira Service Desk project and a Jira Software project to allow stakeholders to submit new ideas through a user-friendly Service Desk form. After feedback is submitted to the form, a ticket is created in that Service Desk project, which immediately closes it out and copies it into a software project, creating visibility across multiple teams.
